# EDTC 810 STATISTICS FOR EDUCATION RESEARCH 

## PROJECT 4

College Basic Mathematics' Online Assessment Statistical Analysis for Fall 2015 and Fall 2018

Aminata E. Adewumi

New Jersey City University

## Introduction

Mathematics adaptive learning assessment with traditional learning method has been beneficial to many institutions around the country to help close the achievement gap and minimized students' anxiety toward the subject. The adaptive learning assessment for this study is MyMathLab (MML) which was created by Pearson. MyLab and Mastering from Pearson is a convenient online device that enhances, motivates, and engages students in productive learning; when MML is used adequately, the success rate can be very impressive based on the report of their 13 case studies (Pearson, n.d.). Using MML tools such as e-text, homework assignments, videos, study plan, diagnostic tests or quizzes allowed students to understand and personalize their own learning outcome.

Pearson's report indicated that the University of Memphis (UM) Department of Mathematics Sciences and Jackson State Community College (JSCC's) successfully use MML to improve their students' retention, achievement, and withdrawal rate. According to the report, Memphis Mathematics Method's (MMM's) withdrawal rate was lower than their traditional learning method from 17.9 to 8.4 percent; whereas 49 percent of scholars in traditional learning passed compared to 72 percent using MMM teaching method in 2008 (Pearson, n.d.). Furthermore, Jackson State Community College (JSCC's) implemented a SMART Math design with MyMathLabPlus that increased their completion rates by 51 percent, retention rate by 13.5 percent, and decreased their fail and withdrawal rate by 40 percent (Pearson, n.d.). For this study, the researcher analyzed students' College Basic Mathematics' MyMathLab assessment from Fall 2015 and Fall 2018 to explore the remarkable difference or trend based on the gender category. Therefore, the researcher's hypothesis is:

H0: There is no big difference for the Fall 2015 and Fall 2018 Mathematical report, or trend based on gender.

H1: There is a big difference in the Fall 2015 and Fall 2018 Mathematical report, or trend based on gender.

## Data Analysis, Collection, and Sampling

The researcher collected data from Fall 2015 and Fall 2018 of a College Basic Mathematics class taught by Professor X. The sample population is based on higher education students from University XYZ. The purpose of the data collection was to determine the significant difference for both years with the same type of class taught by the same professor when using MyMathLab assessment. The categorical variables were gender and student\#; while the quantitative variables were homework and final exam scores for both years. In general, the homework and final exam result were based on students' progress and assignments on MML (see Appendix A). The passing score for the final exam is 70 percent or higher. The homework was mandatory; if the homework was not accomplished the tests or final exam was not to be taken. Therefore, the purpose of choosing both homework and final exam as the quantitative variables was to determine if the homework contributed to the students' success; test 1 , test 2 , and test 3 were also used for the final class calculation. Furthermore, the mean, median, mode, minimum, maximum, range, variance, sum, and standard deviation were calculated using descriptive statistics. The inferential statistics, descriptive analysis, independent t-test, and ANOVA were also performed. Statistical significance is the process in which two or more variables is caused by something other than a random chance. According to Salkind (2017), statistical significance is "the degree of risk you are willing to take that you will reject a null hypothesis when it is
actually true" (Salkind, 2017). Statistical significance is based on the interpretation of the pvalue which is mainly less than 0.05 . Type I and II errors were based on the statistical significance of the data in the research study. If the null hypothesis $(\mathrm{H} 0)$ is true or false; the study might reject H 0 or fail to reject the H 0 . In the case where H 0 is true but there is a rejection, it can become type I error. The null hypothesis for this study is 'there is no big difference for the Fall 2015 and Fall 2018 Mathematical report, or trend based on gender' when N = 26 for Fall 2015 and $\mathrm{N}=29$ for Fall 2018 report.

## Data Representation and Summary of Statistical Description

The Fall $2015(\mathrm{~N}=26)$ and Fall $2018(\mathrm{~N}=29)$ participants' data collection from University XYZ $(\mathrm{N}=26)$ were analyzed. SPSS was used to conduct the statistical analysis for this study. Descriptive statistics such as mean, standard error of mean, median, mode, minimum, maximum, range, variance, sum, and standard deviation were used to structure and describe the data collection (Salkind, 2017). For the Fall $2018(\mathrm{~N}=29)$ with no missing values, Table 1 indicates the mean score of 73.5697 and 46.810 , the median of 95 and 60 , mode of 100 and 0 , and standard deviation of 36.25 and 35 for the Homework (HW2018) and Final Exam (FINAL2018) respectively (see Table 1). In addition, Table 1 also shows Fall $2015(\mathrm{~N}=26)$ with no missing value, the mean scores are 85.303 and 67.981 , the median of 91.77 and 77.5 , mode of 27.72a and 90, and standard deviation of 18.24 and 28.52 for the Homework (HW2015) and Final Exam (FINAL2015) respectively. The minimum for HW2015 was 27.72; the maximum was above 80 percent in each category. The difference means for the homework was 11.73 and the final exam was - 21.17; these results indicate that both assignments were
significantly decreased from 2015 to 2018. Furthermore, Figure 1-4 indicate a clear histogram representation (see Figure 1, Figure 2, Figure 3, and Figure 4).

## Table 1. Descriptive Statistics

|  | HW2018 | FINAL2018 | HW2015 | FINAL2015 |

Figure 1. Histogram of Fall 2018 Homework for College Basic Math scores

FINAL2018

Figure 2. Histogram of Fall 2018 Final Exam for College Basic Math scores

Figure 3. Histogram of Fall 2015 Homework for College Basic Math scores

FINAL2015

Figure 4. Histogram of Fall 2015 Final Exam for College Basic Math scores

The 2015 and 2018 final exam figures (Figure 2 and Figure 4)shows a huge difference on the number of participants who did not take the final exam and received a grade of zero because their homework was not accomplished or due to absences. In addition, based on both figures, more participants received above 80 percent grade in 2015 than in 2018.

## Statistical Description by Gender

The researcher analyzed the Fall 2018 and Fall2015 College Basic Math scores by gender in Table 2 and 3 to statistically differentiate them. Table 2, Fall 2018 data, shows the mean of 80.746 for HW2018 and 49.25 for FINAL2018 in male $(\mathrm{N}=10)$; the mean of 69.79 for HW2018
and 45.53 for FINAL2018 in female $(\mathrm{N}=19)$. In addition, Table 3, Fall 2015 data, shows the mean of 91.34 for HW2015 and 76.818 for FINAL2015 in male $(\mathrm{N}=11)$; the mean of 80.87 for HW2015 and 61.50 for FINAL2015 in female $(\mathrm{N}=15)$. The homework means difference for the males is - 10.59 and females is 11.08 . The homework standard deviations are 26.53 in 2018 and 11.49 in 2015 for males with a difference of $15.05 ; 40.60$ in 2018 and 21.21 in 2015 for females with a difference of 19.39. The final exam standard deviations are 37.58 in 2018 and 25.89 in 2015 for males with a difference of $11.69 ; 34.57$ in 2018 and 29.46 in 2015 for females with a difference of 5.11. The researcher determined that the females' mean scores were significantly higher than the males; however, the standard deviation for males was higher differences than females. Figure 5-8 shows the gender scatter plot and regression plot; which clearly shows how the values come together in the figures (See Figure 5, 6, 7, and 8). Finally, the results are the scores in 2018 homework for male $(\mathrm{N}=10, \mathrm{M}=80.74, \mathrm{SD}=26.53)$; in 2015 homework for male $(\mathrm{N}=11, \mathrm{M}=91.34, \mathrm{SD}=11.49)$; in 2018 final exam for male $(\mathrm{M}=49.25, \mathrm{SD}=37.58)$; and in 2015 final exam for male $(M=76.81, S D=25.89)$. For female, the 2018 homework $(\mathrm{N}=$ 19, $\mathrm{M}=69.79, \mathrm{SD}=40.60) ; 2015$ homework $(\mathrm{N}=15, \mathrm{M}=80.87, \mathrm{SD}=21.21) ; 2018$ final exam $(M=45.53, S D=34.57)$; and 2015 final exam $(N=15, M=61.50, S D=29.46)$.

Table 2. Group Statistics by Gender for Fall 2018

|  | Gender2018 | N | Mean | Std. Deviation | Std. Error Mean |
| :--- | :--- | :---: | :---: | :---: | :---: |
| HW2018 | M | 10 | 80.7460 | 26.53310 | 8.39050 |
| FINAL2018 | M | 19 | 69.7926 | 40.59687 | 9.31356 |
|  | F | 10 | 49.250 | 37.5842 | 11.8852 |
|  |  | 19 | 45.526 | 34.5666 | 7.9301 |

|  |  | 15 | 61.500 | 29.4564 | 7.6056 |

Note. Descriptive statistics by Gender for Fall 2015

## Descriptive Statistics using Independent Sample T-Test

Table 4 and 5 demonstrate the results of the sample t-test comparing the homework and final exam for each year. The sample $t$-test indicates that there is no significant difference in the scores; conditions for the 2018 homework with $\mathrm{t}(27)=0.76$ with $\mathrm{p}=0.449 ; 2018$ final exam with $\mathrm{t}(27)=0.268$ with $\mathrm{p}=0.791 ; 2015$ homework with $\mathrm{t}(24)=1.48$ with $\mathrm{p}=0.15 ; 2015$ final
exam with $\mathrm{t}(24)=1.38$ with $\mathrm{p}=0.18$. These results show greater p -value (more than 0.05 ) exist in the homework and final exam for both years; therefore, the null hypothesis is accepted, There is no significant difference for the Fall 2015 and Fall 2018 Mathematical report.

Table 4. Independent Samples T-Test 2018

## Descriptive Statistics on Analysis of Variance (ANOVA)

The researcher conducted a One-Way Analysis of Variance (ANOVA) for the College Basic Math scores for 2018 and 2015 shown in Table 6 and 7 to compare any significant changes with all test scores. The one way ANOVA shows that in 2018 homework scores $(\mathrm{F}(14,14)=$ 4.31, $\mathrm{p}=0.005)$, Test $1(\mathrm{~F}(14,14)=1.41, \mathrm{p}=0.27)$; Test $2(\mathrm{~F}(14,14)=6.45, \mathrm{p}=0.001)$, and 2018 Test $3(\mathrm{~F}(14,14)=95.14, \mathrm{p}=0.000)$. Furthermore, the one way ANOVA shows that in 2015 homework scores $(\mathrm{F}(11,14)=11.73, \mathrm{p}=0.000)$, Test $1(\mathrm{~F}(11,14)=1.83, \mathrm{p}=0.14)$, Test $2(\mathrm{~F}(11,14)=9.084, \mathrm{p}=0.000)$, and Test $3(\mathrm{~F}(11,14)=17.82, \mathrm{p}=0.000)$. The tests had more significance difference than the homework.

## Conclusion

Finally, the results for this study showed that the descriptive analysis for 2018 homework for male $(\mathrm{N}=10, \mathrm{M}=80.74, \mathrm{SD}=26.53)$; in 2015 homework for male $(\mathrm{N}=11, \mathrm{M}=91.34, \mathrm{SD}$ $=11.49)$; in 2018 final exam for male $(\mathrm{M}=49.25, \mathrm{SD}=37.58)$; and in 2015 final exam for male $(M=76.81, S D=25.89)$. For female, the 2018 homework $(N=19, M=69.79, S D=40.60) ;$ 2015 homework ( $\mathrm{N}=15, \mathrm{M}=80.87, \mathrm{SD}=21.21$ ); 2018 final exam $(\mathrm{M}=45.53, \mathrm{SD}=34.57)$; and 2015 final exam $(\mathrm{N}=15, \mathrm{M}=61.50, \mathrm{SD}=29.46)$. The results and figures (Figure $1-8)$ above indicated that there was not much difference in the results of both years. The sample t-test
also indicated that there is no significant difference in the scores; conditions for the 2018 homework with $\mathrm{t}(27)=0.76$ with $\mathrm{p}=0.449 ; 2018$ final exam with $\mathrm{t}(27)=0.268$ with $\mathrm{p}=0.791$; 2015 homework with $\mathrm{t}(24)=1.48$ with $\mathrm{p}=0.15 ; 2015$ final exam with $\mathrm{t}(24)=1.38$ with $\mathrm{p}=0.18$. A greater p-value (more than 0.05 ) showed in the homework and final exam for both years; therefore, the null hypothesis was accepted, there is no significant difference for the Fall 2015 and Fall 2018 Mathematical report.

The one-way ANOVA did show a slight difference in the tests. 2018 homework scores $(\mathrm{F}(14,14)=4.31, \mathrm{p}=0.005)$, Test $1(\mathrm{~F}(14,14)=1.41, \mathrm{p}=0.27)$; Test $2(\mathrm{~F}(14,14)=6.45, \mathrm{p}=$ $0.001)$, and 2018 Test $3(\mathrm{~F}(14,14)=95.14, \mathrm{p}=0.000)$. Furthermore, the one way ANOVA shows that in 2015 homework scores $(\mathrm{F}(11,14)=11.73, \mathrm{p}=0.000)$, Test $1(\mathrm{~F}(11,14)=1.83, \mathrm{p}$ $=0.14)$, Test $2(\mathrm{~F}(11,14)=9.084, \mathrm{p}=0.000)$, and Test $3(\mathrm{~F}(11,14)=17.82, \mathrm{p}=0.000)$. The researcher would have been able to have better results if the sample size was greater.
